Basic Building Blocks of Information

WHAT IS DATA?

Data can consist of unprocessed meaningless facts and figures which is basically formed by using a combination of alphabetical and numerical characters.

The term data is used to refer raw facts and figures which are input into a system in order to process and create meaningful information. Which neither bear a particular meaning nor have organized in order to make decisions

HOW IT IS FORMED

As mentioned in the above definition it can basically consist of text but not only text.

- 1. Text
 - Numerical : (0..9)
 - Characters : (a..z, A..Z, ಥ, ල)
 - Codes : (;;;)
 - Special Characters : (@,#,%)
- 2. Visuals
- 3. Audio
- 4. Sensors

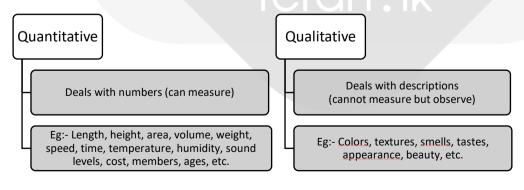

FORMATS OF DATA

- Picture (.jpg, .png, .bmp, .tiff and etc..)
- Text (ASCII, UNICODE and etc..)
- Audio (MP3, WAV, WMA, OGG, M4A and etc..)
- Video (WMV, AVI, FLV, MPG, 3GP, MP4 and etc..)

CLASSIFICATION OF DATA

Data can be classified into two main categories.

- Qualitative data: which cannot be presented numerically
 - ex: shape, colour, visual, sound
- Quantitative data: which can be presented as a quantity or numerically
 - ex: arithmetical process, number of apples in a basket

LIFE CYCLE OF DATA

3. Removal of Obsolete Data

1. Data Creation

2. Management

For the purpose of creating meaningful information, data should be introduced into the system or created inside the system.

Data can be identified as the inputs into a system that intents to create meaningful information. Information can be defined as the data organized meaningfully. Creation of information can be identified as processing of data. For the purpose of processing there should be instructions to follow. After processing data according to the instructions given, information is produced which is the outcome the processed data. Although information is an output of a process the same information would be a data for another process. Thus, data and information can be identified distinctly through examining inputs and

outputs of a particular process.

What is Information?

Refers to processed data which is relevant, converted and filtered to be meaningful and useful to the user and also which can be used to update knowledge of a particular person.

Valuable information should have characteristics such as relevance, timeliness, accuracy, completeness, and understandability. Valuable information assists to make smart decisions.

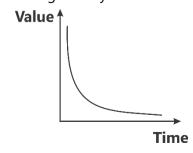

CHARACTERISTICS OF INFORMATION

- Relevance–Value of the information will depend on its relevance for a particular person.
- Timeliness–An information should be updated. Timely information is valuable for making effective decisions.
- Accuracy Accurate information is helpful for making correct decisions.
- Completeness Information presented with the context are useful where incomplete information is not sufficient to make decisions.
- Understandability Information should be clear and unambiguous.

VALUE OF INFORMATION

- The value of information depends on its relevance.
- Information has a great value the moment it is created or at the moment it is received.
- The Golden Rule of Information states that the value of information diminishes with the passage of time.

The **golden rule of information** graphically represents the value of information in its maximum level at the moment the information is created or the information is released. The value of the information is reduced gradually with the time and become less valuable.

BIG DATA ANALYTICS

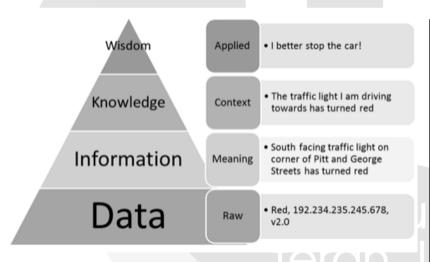

Organizations such as private companies and research institutions capture terabytes of data about their users' interactions in businesses and social media. The volume of data that one has to deal has been exploded to unimaginable levels with the time. The challenge of this era is to make sense of this large amount of data. This is where the big data analytics is needed to manage the data life cycle. Big Data Analytics largely involve collecting data from different sources, manage it in a way that it becomes available to be consumed by analysts and finally deliver data products to fulfil the organization's data requirements.

WHAT IS KNOWLEDGE

Knowledge is what I already understand, and information is what I don't yet understand but need to understand, to make a decision that helps me fulfill a purpose

- Is the skills and specialty acquired by an individual through education or experience.
- That which is conserved in the mind when a subject is used practically and understood theoretically.

UNDERSTANDING DATA, INFORMATION, KNOWLEDGE AND WISDOM

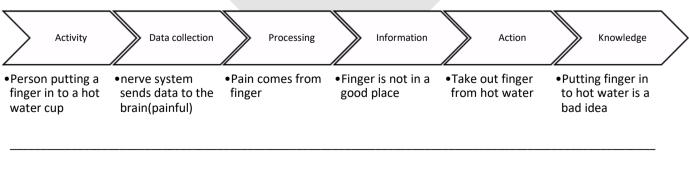

The example I usually use to bring it to life is that of a traffic light changing colour from yellow to red.

At a data level there is a single bit of information, isolated from context and basically without meaning, unless one is familiar with that particular data type.

That data becomes information when meaning is given to it so that a human can more easily understand it.

The information becomes knowledge when context is considered, in this case that the traffic light is one I am heading towards.

Wisdom is exhibited when that knowledge is applied to my situation, so that I stop the car at the red light.

Need of Technology to Create, Disseminate and Manage data and information

Making Decisions

Information is useful for making decisions of day to day life. To make plans, schedules, and policies information are needed. Today's information would helpful to predict how it would be in the future. For an example, present information on currency exchange would be helpful to predict that for the following month or for the following year.

Manual Methods

Data processing and information creation can be done manually. Some drawbacks occur such as consuming more time in entering and organizing data manually. Also, human errors in data processing may lead to inaccurate information. Manual methods are inefficient in sharing information and hard to provide a quality service to the customer.

Further Drawbacks of Manual Methods

- Unreliability
- Slowness
- Inaccuracy
- Security Issues
- Sharing Issues
- Lack of reusability
- Durability Issues
- Vulnerability (theft / fire)

Data Inconsistency

Data inconsistency may occur in manual methods of manipulating data and information. Data inconsistency is, occurring the same data in two different files in different formats or values. When same data exist in different files, updates cannot be done easily.

AUTOMATIC DATA PROCESSING

Automatic data processing in contrast to manual data processing, utilizes technology to store, process and retrieve data. Automatic data processing handles data more efficiently than manual data processing and requires considerably less human interaction than in manual data processing. Some everyday applications in which automatic data processing outperforms manual data processing are emergency broadcast signals, security updates and weather advisories. In situations such as bad weather, harmful radiation and in some scientific or space research and also in war areas in which manual data processing is not possible, automatic methods save human lives.

Global Village

With the dawn of Information and Communication Era, it has turned the world into a global village. Endless connectivity, interactive technologies, information sharing and infinite access of data by means of networking eliminate drawbacks of manual data manipulation and make available a fast, easy, convenient and accurate information creation and dissemination. ICT has emerged as a key tool for influencing the process of organizations and people around the world catching up with the technological advancement such as the Internet, the WWW, mobile communication, mobile computing and cloud computing, etc.

EMERGENCE OF I.T. ERA

There is hardly a sphere of our lives which has not in some way been effected by ICT. We will look at how ICT has affected our lives & society both in a positive and a negative way. We will focus on the following areas.

- Manufacturing & Industry (CAD)
- Commerce (E-commerce): Ebay, Amazon
 - o Banking (MICR for cheques, ATM, electronic direct debit for salary payments)
 - Business (B2C, B2B)
- Medicine (Expert Systems, Robots for brain surgeries and etc)
- Education (E-learning, Distant Learning, Ebooks, Learning CDs)
- Home (Play Games, Prepare documents, Camera Systems)

THE INTERNET

The history of internet goes back a lot further, all the way back to the 1950s and 60s. However, the following shows a brief timeline which highlights some major milestones achieved through the development of internet over 49 years.

1957	the U.S. government formed the Advanced Research Projects Agency (ARPA), a segment of the Department of Defense charged with ensuring U.S. leadership in science and technology with military applications.
1961	Len Klein rock(Professor of Computer Science at UCLA) – Packet Switching theory
1962	J.C.R. Licklider & W. Clark write first paper on Internet Concept
1965	First Network Experiment: Directed by Larry Roberts at MIT Lincoln Lab, two computers talked to each other using packet-switching technology.
1966	ARPA project begins. Larry Roberts is chief scientist
1969	ARPANet network implemented with four nodes at UCLA Network Measurement Center
1972	First basic e-mail programs written by Ray Tomlinson at BBN
1974	Vint Cerf and Bob Kahn publish "A Protocol for Packet Network Interconnection," which details the design of TCP. And in 1978 this split into TCP/IP
1976	Ethernet developed by Robert Metcalfe
1979	USENET created by Tom Truscott and Jim Ellis

1981	IBM announces its first Personal Computer. Microsoft creates DOS
1983	Domain Name System (DNS) designed by Jon Postel, Paul Mockapetris, and Craig
	Partridgeedu, .gov, .com, .mil, .org, .net, and .int created.
	Fidonet, the first dialup network implemented
1990s	ARPAnet ends. Tim Berners-Lee creates the World Wide Web
	*lot of major web based products introduced by many different companies
2000s	185 countries connected, 70000 computer networks which become an
	enormous network

ARPANET to WWW

In response to the threat of nuclear attack, ARPANET was designed to allow continued communication if one or more sites were destroyed. In the beginning ARPANET served only computer professionals, engineers, and scientists who knew their way around its complex workings. Today, the Internet is a public, cooperative, and self-sustaining facility accessible to millions of people worldwide. Physically, the Internet uses a portion of the total resources of the currently existing public telecommunication networks. The Internet uses a set of protocols called TCP/IP (Transmission Control Protocol/Internet Protocol). A protocol is an agreement or law behind the data transmission over networks. TCP is a reliable transmission protocol.

Services provided by the Internet

Services provided by the Internet are World Wide Web (WWW), File Transfer (FTP), email, Video conferencing, Telnet, File sharing, Internet Relay chat, IP Telephone and IPTV. Electronic mail (e-mail) has replaced the postal letters. Live conversations can be carried out with other computer users, using the Internet Relay Chat (IRC) and more recently, the Internet telephony hardware and software allows real-time voice conversations. Real time voice and video can be transmitted over network with the use of video conferencing technologies. WWW allows users to view web pages distributed over the Internet and reach to the information they wish to find from anywhere anytime. File transfer allows users to transfer files over the Internet and Telnet facilitates remote login.

WORLD WIDE WEB

The World Wide Web came into being in 1991. Tim Berners-Lee is the developer of the WWW and at the moment who directs the World Wide Web Consortium (W3C), a group of industry and university representatives that oversees the standards of Web technology.

HTTP

HTTP is the set of rules for exchanging files (text, graphic images, sound, video, and other multimedia files) on the World Wide Web. Hypertext is the documents that make content on the web and it is possible to connect hypertext documents by means of hyperlinks. To view files on the Web, it is needed a web browsing software. This software is used to view different documents on the Web, which are known as Web pages. A collection of one or more web pages is a Web site. The first page of a Web site is often called as the home page. Each web site in the www has a unique address which is called the Uniform Resource Locator (URL).

MOBILE COMMUNICATION AND MOBILE COMPUTING

Mobile communication involves the transmission of information over a distance without the help of wires, cables or any other forms of electrical conductors. Initially the mobile communication was limited between one pair of users on single channel pair.

Multiple Users

To accommodate multiple users Time Division Multiple Access (TDMA), Code Division Multiple Access (CDMA), Frequency Division Multiple Access (FDMA) and their hybrids are used.

Mobile Computing is a technology that allows transmission of data, voice and video via a computer or any other wireless enabled device without having to be connected to a fixed physical link.

CLOUD COMPUTING

The term Cloud refers to a Network or Internet. A Cloud is present at a remote location and provides services over a network. Applications such as e-mail, web conferencing, customer relationship management (CRM) run in clouds. Cloud Computing refers to manipulating, configuring, and accessing the applications online. It offers online data storage, infrastructure and application. Cloud Computing provides access to applications as utilities, over the Internet.

There are reference models on which the Cloud Computing is based. These can be categorized into three basic service models as listed below:

- 1. **Infrastructure as a Service (laaS)** provides access to fundamental resources such as physical machines, virtual machines, virtual storage, etc.
 - **Ex** Customer Relationship Management, games, virtual desktop applications, Amazon EC2, Windows Azure, Rackspace, Google Compute Engine
- 2. **Platform as a Service (PaaS)** provides the runtime environment for applications, development & deployment tools, etc. As the name suggests, provides you computing platforms which typically includes operating system, programming language execution environment, database, web server etc.
 - **Ex** Database, web server, deployment tools, AWS Elastic Beanstalk, Windows Azure, Google App Engine.
- 3. **Software as a Service (SaaS)** allows to use software applications as a service to end users. You don't have to worry about the installation, setup and running of the application. Service provider will do that for you. You just have to pay and use it through some client.
 - Ex Salesforce.com, Microsoft Office 365, Google Apps, Dropbox

Abstract Model of Information Creation

ABSTRACT MODEL OF INFORMATION

- Input is the activity of getting data which then need to send for processing
- Processing is the activity of getting data as input and convert them into information as output
- Output is the activity of sending Information that is converted after processing

WHAT IS A SYSTEM?

System comprises of interrelated components work together to achieve a common goal or an objective.

A school, a vehicle or a bicycle can be introduced as a system. A system consists of interrelated components / sub systems and system should be analyzed to identify inputs, outputs, subsystems and their individual responsibilities. In an information system data input into the system is processed using processing instructions given and information is produced as output. This is called an abstract model of information.

COMPONENTS OF A COMPUTER SYSTEM Computer System Hardware Software **Firmware** Liveware Input System Output Application Control and **Proprietary** Processing Memory **Open Source** Communication

HARDWARE

Physical components of a computer are known as hardware.

Hardware components can be categorized into Input Devices, Output Devices, Processing Devices, Networking Devices and Memory Devices.

In addition to those types of hardware there is a circuit board located inside a computer system called mother board by means of which every hardware component are connected to each other.

Input Devices

Input Devices correspond to input data into the computer system.

Output Devices

Devices which support to present information out from the computer system.

When considering monitor (Visual Display Unit) as an output device, there are two kinds of viewing screens used for monitors named as Cathode-Ray Tube (CRT) and Flat-Panel Display. The flat-panel display is divided into two categories as follows.

- Light Emitting Diode (**LED**) These are emissive displays that convert electrical energy into light.
- Liquid Crystal Display (**LCD**)—These are non-emissive displays which use optical effects to convert light into graphics patterns.

Printer is an output device, which is used to print information on paper which is called a hardcopy. There are two types of printers

- **Impact** Printers print the characters by striking them on the ribbon, which is then pressed on the paper. Dot Matrix Printer is an example for impact printers.
- **Non-Impact** Printers Non-impact printers do not physically strike the page. These printers print a complete page at a time, thus they are also called as Page Printers. Laser printers and Inkjet printers are laid on this type of printers

Memory Devices

A memory is used to store data and instructions.

Computer memory is the storage space in the computer system, where data is to be processed and instructions required for processing are stored. The memory is divided into large number of small parts called cells. Each location or cell has a unique address.

Memory is classified into three types -

- **1. Cache Memory** Cache memory is a very high speed semiconductor memory which can speed up the CPU. It acts as a buffer between the CPU and the main memory. It is used to hold those parts of data and program which are most frequently used by the CPU.
- **2. Primary Memory/Main Memory** Primary memory holds only those data and instructions on which the computer is currently working. It has a limited capacity and data is lost when power is switched off. It is generally made up of semiconductor device.

3. Secondary Memory - This type of memory is also known as external memory or non-volatile. It is slower than the main memory. These are used for storing data/information permanently. CPU does not access these memories directly instead they are accessed via input-output routines. The contents of secondary memories are first transferred to the main memory, and then the CPU can access it.

Processing Devices

Central Processing Unit (CPU) is the most common processing device of a computer which has the control of all other components. Arithmetic and logical operations take place inside the CPU.

Graphics Processing Unit (GPU) is a specialized electronic circuit designed to rapidly manipulate and alter memory to accelerate the creation of images in a frame buffer intended for output to a display. GPUs are used in embedded systems, mobile phones, personal computers, workstations, and game consoles.

Networking Devices (Communication)

Computer networking devices are physical devices which are required for communication and interaction between devices on a computer network. Specifically, they mediate data in a computer network.

Ex - Hubs, Switches, Bridges, Routes, Gateways, Network Interface Cards (NICs)

COMPUTER SOFTWARE

Computer software is classified as system software and application software. System software (systems software) is the computer software designed to operate and control the computer hardware and to provide a platform for running application software. System software can be separated into three different categories as follows.

- 1. Operating Systems –Windows, Linux, Mac OS
- 2. Utility Software- Virus Guard, Device drivers
- 3. Language Translators Compiler, Interpreter

Application software products are designed to satisfy a particular need of a particular environment. Application software may consist of a single program, such as Microsoft's notepad for writing and editing a simple text. It may also consist of a collection of programs, often called a software package, which work together to accomplish a task.

Software can also be classified as 'open source software' and 'proprietary software'.

- Open Source Software –source code is available and it is free to use, modify or redistribute these types of software.
- Proprietary Software source code is not available and user should have the permission given by owner of the software to use this type of software.

FIRMWARE

Firmware is a computer program that is "embedded" in a hardware device, that is, an essential part of the hardware. It is sometimes called embedded software. In computers firmware embedded in ROM and which handles booting up process of computers.

<u>/EWARE</u>			
eware refers computer us	ers. According to user comm	ands generally computers a	re functionii
	itaur		
	- teran		

Analyses the Activities of Data Processing

STEPS IN DATA PROCESSING

Following are the steps that is need to be considered when processing data.

Data gathering

Data gathering methods vary as manual methods, Semi-automated and automated methods. Tools used in automated methods.

[Diagram]

Manual Methods

- Questionnaires
- Interviews
- Observations
- Report Inspections

Semi-automatic and Automatic

In semi-automatic and automatic methods OMR, OCR, MICR, card/tape readers, magnetic strip readers, bar code readers, sensors and loggers are popular.

- An Optical Mark Reader (OMR) is a scanning device that reads carefully placed pencil marks on a specially designed form or document. Most popular use of OMR is marking of MCQ answer sheets.
- Optical Character Recognition (OCR) is done by Optical Character Reader which allows us to identify written or printed characters and extract editable text from it.
- Magnetic Ink Character Recognition (MICR) is done by Magnetic Ink Character Reader which supports to input data written in special magnetic ink under cheque.
- Magnetic strip readers use to read data stored in a magnetic strip attached on credit cards and bank ATM cards.
- Bar code readers use visible light to scan and read barcodes which contain data to be input into computer systems.
- Sensors may helpful for collecting data from different places in to a single data center fast.
 Sensor networks are consisting of variety of electronic sensors. Each node in a wireless sensor network is equipped with one or more sensors in addition to a microcontroller, wireless transceiver, and energy source.

Data validation

Validation involves applying a set of conditions checks on input data to check if the data is reasonable enough to be accept by the system. The following are the most commonly use validation checks.

Format check –	Kange check –	
Format check –	Length check –	
	Type check –	
Presence check –	Format check –	
	Presence check –	
	ES OF DATA INPUT	

[Perspectives Diagram]

Direct and remote

In direct data input, data is input into the system directly without direct user interference. In remote entry, system is designed specially to store data. Data storing and transactions are taking place in different geographical places.

Online and offline

In online data input, the data is input at the same time transaction taking place, where data of different transactions input after a specific time period as a batch in offline method.

DATA PROCESSING

Batch vs Realtime

Data input and processing occur as a batch in batch processing. It is easy to handle huge amount of data as a batch. So, data stored until the system comes online to process the data in one 'batch'. Batch processing is done in billing systems and pay roll system.

In real time processing of data, input, processing and output as well as data storing occur simultaneously. Any type of monitoring system, any type of booking system, computer controlled systems such as automatic production line, an aircraft auto-pilot, the system controlling a nuclear power stations uses real time processing.

OUTPUT METHODS

Direct presentation to the user can be done by using a monitor, multimedia projector or a printer. Soft copies are presented with monitors and multimedia projectors whereas printer output printed copies which is said to be hard copies. Storing methods are used to store data securely for further processing needs.

STORAGE METHODS Local storages such as Hard Disks Drives, Compact Disk, Digital Versatile Disks and Tape Drives can be used to store data inside the local computer. Remote storage such as cloud space can be used to store data securely. To get remote data when needed it is required the access to the internet.

Application of I.C.T. in Different Domains

Almost all the fields are affected by I.C.T.

EDUCATION

The computer helps in providing a lot of facilities in the education system. The computer provides a tool in the education system known as CBE (Computer Based Education). CBE involves control, delivery, and evaluation of learning as follows.

1) Simulations:

Computer simulators and prototypes can be used to perform the rather impossible experiments on the subjects which seemed impossible to be done in the labs especially in the field of medicine and engineering.

- 2) Distance Learning and E- Learning: This is the trend in 21st century education where the obstacles arise due to distance are being eliminated. One can attend classes and access learning materials remotely, without having to travel to the learning center.
- 3) Better Content Delivery:

The motivation effect that comes about due to embracing ICT in teaching and learning is a common factor. For instance, multimedia and interactive content on interactive boards remain quite engaging and motivating making students pay more attention in class.

4) Individualized Learning:

ICT help students with individual needs to have better suited assignments and making it easy to organize their learning.

HEALTHCARE

Computers have become an important part in hospitals, labs, and dispensaries. They are being used in hospitals to keep the record of patients and medicines. It is also used in scanning and diagnosing different diseases. ECG, EEG, ultrasounds and CT scans are also done by computerized machines.

Following are some major fields of health care in which computers are used.

- Diagnostic System Computers are used to collect data and identify the cause of illness.
- Lab-diagnostic System All tests can be done and the reports are prepared by computer.
- Patient Monitoring System These are used to check the patient's signs for abnormality (ECG)
- Pharmacy Information System Computer is used to check drug labels, expiry dates, harmful side effects, etc.
- Surgery Nowadays, computers are also used as a supporting tool for surgery.

AGRICULTURE

ICT is applied in the field of agriculture, animal farm houses and fisheries industries. ICT is used to control light, moisture and air inside the greenhouses. Robotic machines are used to monitor plant growth levels, record them and harvesting in large scale farm lands. Crop harvesting and seedling planter robotics are also useful to keep efficiency of agriculture industry. Automatic weed removers and insect control devices protect the crop from weed plants and insects respectively. Monitoring devices are used to monitor factors affect crop production such as weather, climatic changes, rainfall, wind direction, soil fertility and water content.

Radio Frequency Identification Device (RFID) helps in identifying and counting the number of animals in farmhouses. Automated milking and examination of cows can be done with computer controlled systems which is helpful in monitoring the health status of the cows and the quality of milk.

BUSINESS AND FINANCE

A computer has high speed of calculation, diligence, accuracy, reliability, or versatility which has made it an integrated part in all business organizations.

Computer is used in business organizations for payroll calculations, budgeting, sales analysis, financial forecasting, managing employee database and maintenance of stocks etc.

Today, banking is almost totally dependent on computers. Banks provide online accounting facility, which includes checking current balance, making deposits and overdrafts, checking interest charges, shares, and trustee records. ATM machines which are completely automated are making it even easier for customers to deal with banks.

In marketing, advertising and home shopping, computers are widely used today. Advertising professionals use graphics, and animations fascinatedly to get customer attractions. Home shopping has been made possible through the use of computerized catalogues that provide access to product information and permit direct entry of orders to be filled by the customers.

ENGINEERING

CAD (Computer Aided Design) that provides creation and modification of drawing.

3D virtualization also can be done in engineering industry before development of buildings, machinery, and vehicles also. Some machinery can be developed virtually and can be monitored functioning animations on screens.

Computer Aided Software Engineering tools (CASE) supports software engineers for designing, coding, testing and debugging of software.

TOURISM

Internet has facilitated prospective tourist services, communication, and information access. Bringing a better quality of service to the tourism industry, the Internet has pulled down prices, made information widely available, and allowed sellers and buyers to connect more easily and make transactions.

MEDIA AND JOURNALISM

ICT is effectively used in media and Journalism which helps in designing of articles interactively as well as organizing information. Content sharing between broadcasters, and reaching global news fast have become easy with the use of the Internet and Internet services such as www, email, video conferencing and so on.

LAW ENFORCEMENT

ICT is applicable in law enforcement which facilitates information recording and storage, investigations, reporting and statistics. ICT supports the investigations carried out to apprehend criminals. Today CCTV systems, GPS, and telecommunication services provide severe support on criminal investigations.

Notes:-

Evaluates the impact of ICT in the society

SOCIAL AND ECONOMIC BENEFITS OF ICT

Benefits provided by ICT such as social benefits and economic benefits would tend people to embrace the information communication technology.

ICT impact in entertainment and leisure industry has improved the way in which we can entertain ourselves by enhancing and providing people with different ways of entertaining ourselves such as online games and chat with friends etc.

A growing ICT sector can contribute to aggregate increases in productivity, GDP and trade. As people continue to embrace ICT with an aim of making their life better, it may also affect how productive they are. Increase in the size and productivity of the ICT sector, it associate growth in labor productivity, manufacturing productivity and ultimately the economy.

ICT has bridged access to information from anywhere anytime which improves information dissemination around the world. Cloud computing activates better application, services, security, reliability and availability of information.

SOCIAL, ECONOMIC, ENVIRONMENTAL, ETHICAL, LEGAL AND PRIVACY ISSUES CAUSED BY ICT

ICT adoption in industries causes thousands of job losses. This is because computers reduce the number of people needed to perform a particular task.

Negative impacts of entertaining using ICT are time wastage, health issues. Continuous use of ICT for entertainment such as playing games brings health issues. For instance, constant use of thumbs, wrists and eyes can lead to problems such as eyes strain, RSI and other physical problems.

"Digital divide" is an economic and social inequality with regard to access to, use of, or impact of information and communication technologies. Access to appropriate technological resources similar and improvements in ICT education will helpful to overcome digital divide.

Electronic waste or e-waste is becoming a severe problem around the world. The major problem with e-waste is that the toxic chemicals such as lead, arsenic and cadmium can leach into the soil over time and contaminate the drinking water.

Green computing, the study and practice of efficient and eco-friendly computing resources, is now under the attention of not only environmental organizations, but also businesses from other industries. As a result, most countries in the developed world have introduced regulations to prevent e-waste being dumped into landfill. The majority of components in electronic goods now have to be recycled.

Intellectual property rights, patents on academic material, music and software difficult to be protected as how fast they are distributed over networks. Net etiquette/internet ethics are not kept by all of the Internet users.

CONFIDENTIALITY OF DATA OR INFORMATION

Confidentiality of information can be kept with the use of password protection, encryption techniques and digital signatures.

STEALING / PHISHING

Phishing is the attempt to acquire sensitive information such as usernames, passwords, and credit card details for malicious reasons, by masquerading as a trustworthy entity in an electronic communication. To protect data or information against stealing or phishing it is necessary to setup firewall, use of password, apply updates and not opening suspicious emails and clicking on links of untrusted senders.

PIRACY

Software piracy is the illegal copying, distribution, or use of software.

COPYRIGHT / INTELLECTUAL PROPERTY LAWS

Intellectual property is the area of law that deals with protecting the rights of those who create original works. It covers everything from original plays and novels to inventions.

PLAGIARISM

Plagiarism is the stealing of someone else's thoughts, ideas, expressions or work and the representation of them as one's own original work.

LICENSED / UNLICENSED SOFTWARE

A software license is a legal instrument governing the use or redistribution of software. Two common categories for software under copyright law are proprietary software and free and open source software (FOSS). FOSS software licenses both rights to the customer and therefore bundles the modifiable source code with the software (open-source), while proprietary software typically does not license these rights and therefore keeps the source code hidden (closed source). License grants the licensee specific rights to use, edit or redistribution of software.

Unlicensed software outside the copyright protection is either public software or software which is non-distributed, non-licensed and handled as internal resource of an organization.

LEGAL PROTECTION AGAINST LEGAL ISSUES
